Summary of Research Interests

My interdisciplinary research program aims to understand the diverse ways our brains allocate attention by integrating ideas and perspectives across cognitive, computational, and developmental neuroscience. I leverage cutting-edge analytic tools in both large-scale open-source datasets and deeply phenotyped samples, investigating neurophysiological signatures of visual and auditory attention and characterizing differences in attention in depression and anxiety. Motivated by findings that childhood experiences can shape neurocognitive functioning, I currently investigate how childhood environments and experiences shape functional brain network development and cognitive abilities.
